SMi Trial™

"By decreasing protocol deviations, SMi Trial improved data quality and reduced the overall number of patients required for trial completion."

Kent Thoelke
EVP & Chief Scientific Officer | PRA Health Sciences

Phase III Clinical Trial Accelerates Time to Market

A Case Study of SMi Trial Implementation Success

- **Clinical trial completed 7 months early**
- **$250M+ potential additional peak revenue**
- **$100,000+ saved in monitoring**
- **20% fewer screen failures**

Background

A large, global pharmaceutical organization identified one of its investigational CNS drug programs as "the future of the company." The program's multi-arm, Phase II trial was jeopardized by enrollment errors and protocol deviations despite the deployment of hands-on site training. The sponsor selected PRA Health Sciences to help mitigate these risks in their upcoming global Phase III study. ***In order to scale the trial globally and ensure the quality of the clinical data, PRA implemented SMi Trial™ and exceeded the sponsor's expectations.***

Phase II Challenges

- High placebo rates requiring hands-on site training that would be impossible to implement globally
- Errors in subject enrollment into each study arm caused by misdiagnosis of disease subtypes
- Mistakes in dosing, timing of interventions, and measurements as they varied by visit and study arm

Phase III Expectations

- Complete study 6 months sooner
- Streamline enrollment
- Reduce subject costs
- Prevent protocol deviations
- Standardize compliance across 142 global sites and 40 CRAs
- Ensure clinical data quality

SMi Trial™

Solution

"SMi Trial allowed study teams and site staff to learn on their own time and at their own level, which greatly facilitated the understanding of the therapeutic area and the protocol. This training improved comprehension and the consistency of messaging, and ultimately led to better study conduct."

- Wendy Martin, MD, Senior Medical Director, PRA Health Sciences

SMi Trial Feature	Critical Fix
Interactive, multimedia eLearning focused on key risks of the clinical trial	Delivered modern, engaging protocol education that reduced placebo rates and prevented major mistakes during study execution
Mobile-friendly delivery with just-in-time access	Fought the "forgetting curve" by allowing site staff to reference training materials, including required activities, prior to patient visits
Modular approach that facilitates knowledge retention and includes role-based assignments	Trained the entire study team while tailoring information to each member's role and education
Integrated assessment questions and inspection-ready audit reports	Identified misunderstandings that led to focused interventions by CRAs during site visits

Complete Results

FDA and EMA approvals ahead of schedule

- Trial completed 7 months early
- Deviation rates among the lowest of all studies in the CRO's history
- $250M+ potential additional peak revenue
- $100,000s saved in monitoring
- Significantly lower placebo rates
- ZERO audit findings across training, compliance, and patient protection

About ScienceMedia

ScienceMedia improves on-the-job clinical competency by teaching complex science in easier ways to Life Sciences-focused organizations.
